

Process Performance Management

Adela del Río Ortega

Virtual Lecture Series on BPM – TU Dortmund

Introduction

The BPM Lifecycle

Introduction

Process Performance Indicators

What are performance indicators?

The attendance to lectures must be increased in 15% before the end of this semester.

Key Performance Indicator

Key performance indicators (KPIs) are **quantifiable metrics** that an organization uses to evaluate its **performance** in terms of meeting its **strategic, tactic and operational goals**.

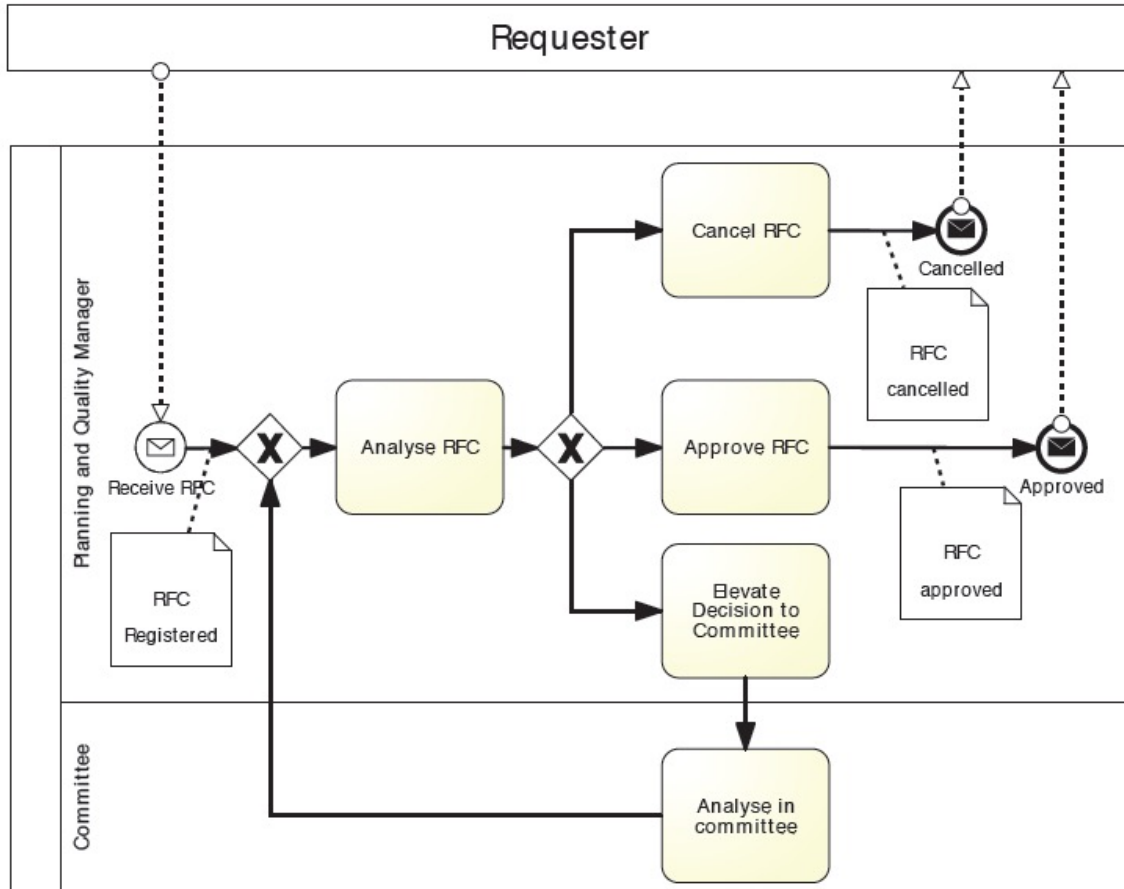

[A. Neely et al., 2005]

Process Performance Indicator (PPI)

Process performance indicators (PPIs) are **quantifiable metrics** that measure business activity against a **goal**. They allow an evaluation of the **efficiency and effectiveness** of business processes and can be measured directly by **data generated within the process flow** and are aimed at the process controlling and continuous optimization.

[G. Chase et al., 2011]

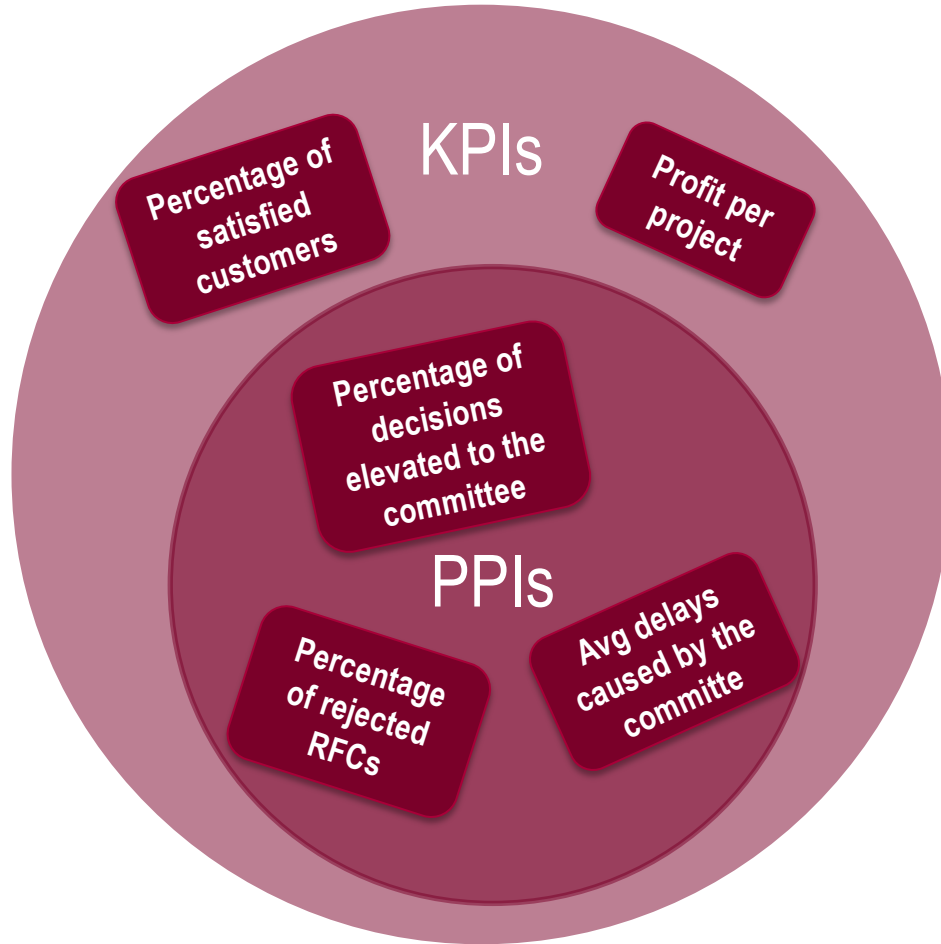

Some examples

A measuring tape icon is positioned vertically on the left, with three circular gauges to its right. Red lines connect the gauges to three separate text boxes on the right.

- Top Gauge:** Average delays caused by the committee must be less than 4 days
- Middle Gauge:** Percentage of decisions elevated to the committee must be less than 20%
- Bottom Gauge:** Percentage of rejected RFCs must be less than 30%

PPIs vs KPIs

What are they for?

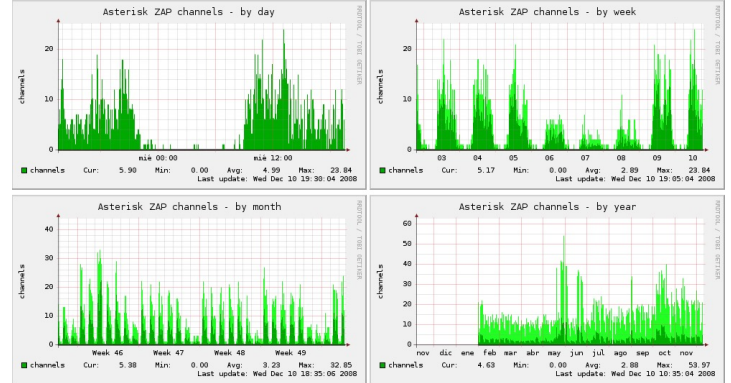

Process Performance Indicator (PPI)

Process performance indicators (PPIs) are **quantifiable metrics** that measure business activity against a **goal**. They allow an evaluation of the **efficiency and effectiveness** of business processes and can be measured directly by **data generated within the process flow** and are **aimed at the process controlling and continuous optimization**.

[G. Chase et al., 2011]

Introduction

Process Performance Indicators

Process Performance Management

Why should we manage process performance?

Performance Measurement Models

Balanced Scorecard
(Kaplan & Norton,
1996)

Performance
measurement matrix
(Keagan et al.)

Performance pyramid
(Lynch and Cross)

Performance prism
(Adams & Neely,
2002)

EFQM

- They provide a global vision of WHAT should be measured in an organization (e.g. financial perspective, customer perspective, internal business process perspective, learning and growth perspective)
- It's important to measure process performance (besides other perspectives)

How should we manage process performance?

What PPIs should I define?

Process performance indicators are multi-dimensional

Devil's Quadrangle Dimensions

TIME

COST

QUALITY

FLEXIBILITY

Brand and Kolk, 1995

Dumas et al., 2013

Devil's Quadrangle Dimensions

TIME

COST

QUALITY

FLEXIBILITY

Cycle time

Waiting time

Service time

...

Devil's Quadrangle Dimensions

TIME

COST

QUALITY

FLEXIBILITY

Processing, management or support cost

Activity cost

Unit cost

...

Devil's Quadrangle Dimensions

TIME

COST

QUALITY

FLEXIBILITY

Product or service meets expectations

Promises made to clients are fulfilled

Documents and data are properly managed

Decisions made are correct...

Devil's Quadrangle Dimensions

TIME

COST

QUALITY

FLEXIBILITY

Capacity to execute new tasks

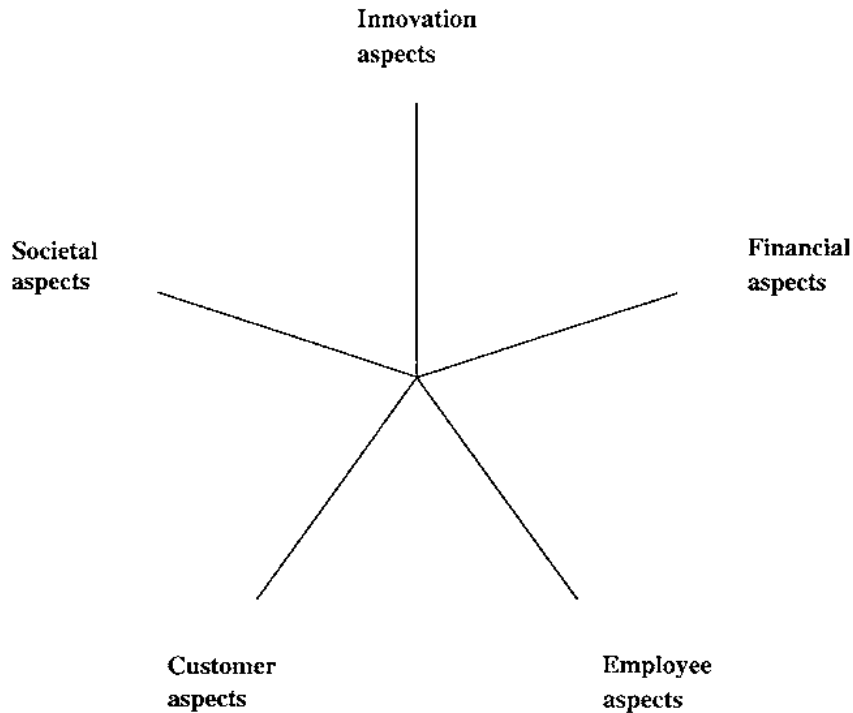

Capacity to adapt to different workloads

Capacity to change rules/assignments

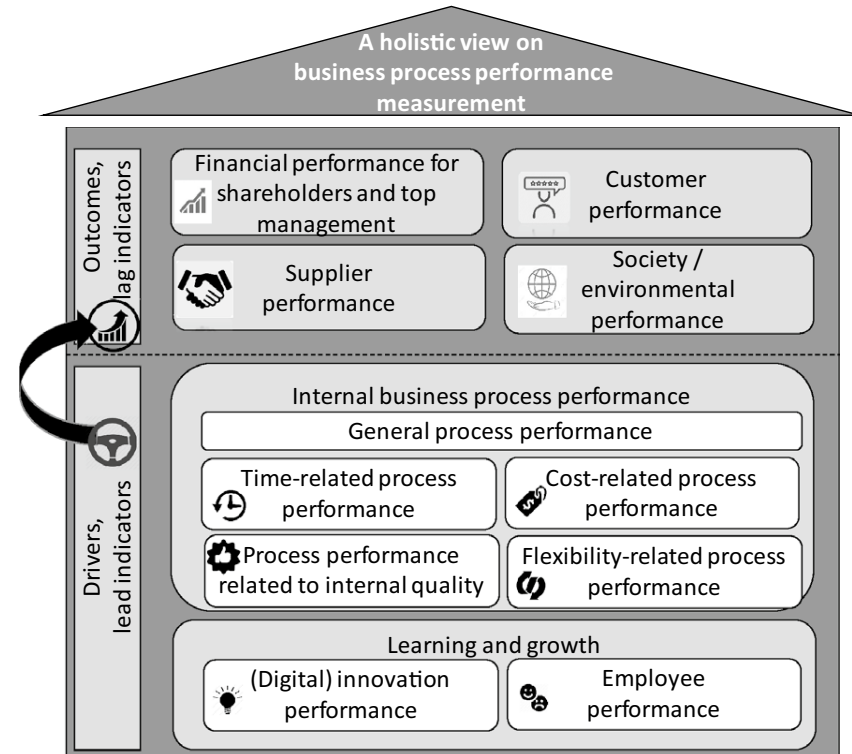

...

However, one may find different classifications

Kueng, 2000

Van Looy and Shafagatova, 2016

That's all Folks!

Really?

Let's take this quality metric...

Product or service meets expectations

Be SMART

Be SMART

An indicator has to be **specific**

For a Make-to-Order process, product or service that meets expectations could be...

If the products ordered are the products provided and the quantities ordered match the quantities provided

If the location, specified customer entity and delivery time ordered are met

If documentation supporting the order is accurate, complete and on time

If it is delivered on specification, with no damage and accepted by the customer

Another example

Cycle time

Is it?

Average cycle time

Cycle time variance

Percentage of cases with cycle time less than 5 days

Be SMART

For a Make-to-Order process, product or service that meets expectations could be...

If the products ordered are the products provided and the quantities ordered match the quantities provided

If the location, specified customer entity and delivery time ordered are met

If documentation supporting the order is accurate, complete and on time

If it is delivered on specification, with no damage and accepted by the customer

Wait a minute...

How do we measure that the order is delivered on specification, with no damage and accepted by the customer?

We need to **operationalize** the metrics for our processes
and information systems

For example

How do we measure that the order is delivered on specification, with no damage and accepted by the customer?

No return activity is done by the customer after delivery

What if we have an event log as data source for computing our metrics?

Since event logs are a very common way of learning the behaviour of a process

What can we measure in an event log?

Which information do we have from an event log?

In summary

- Time, Count, Data measures
- Derived measures (boolean / arithmetic operations)
- Aggregated measures (aggregation operations)

We must take into account that

Not everything can be accurately
measured

The effort of measuring
something must be worth it

Be SMART

If a PPI cannot be achieved, then it becomes useless

Be SMART

Start with strategic goals

Specific to the organization

Cycle time or activity time may not be relevant in some cases

Delays caused by the committee

Time to incident resolution (not incident closed)

Lag vs Lead indicators

LAG INDICATORS MEASURE GOAL ACCOMPLISHMENT,
EASY TO MEASURE BUT HARD TO INFLUENCE

LEAD INDICATORS PREDICT GOAL ACHIEVEMENT,
CAN BE INFLUENCED

To be 5 kg lighter

by EOY

Indicators are not static

Be SMART

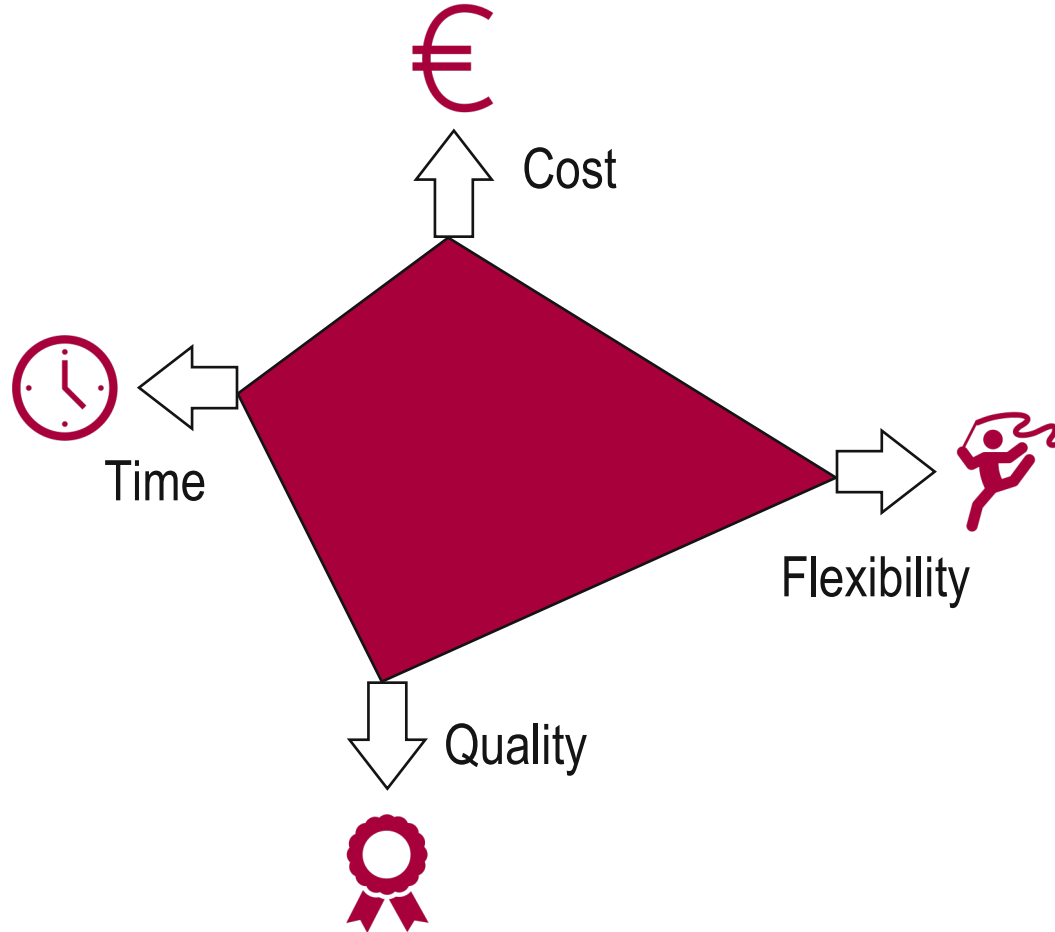

Defined within a time-frame

Be SMART

Be balanced

Be selective

Example

NASA'S GOALS IN 1958

1. The expansion of human knowledge of phenomena in the atmosphere and space;
2. The improvement of the usefulness, performance, speed, safety, and efficiency of aeronautical and space vehicles;
3. The development and operation of vehicles capable of carrying instruments, equipment, supplies, and living organisms through space;
4. The establishment of long-range studies of the potential benefits to be gained from, the opportunities for, and the problems involved in the utilization of aeronautical and space activities for peaceful and scientific purposes;
5. The preservation of the role of the United States as a leader in aeronautical and space science and technology and in the application thereof to the conduct of peaceful activities within and outside the atmosphere;
6. The making available to agencies directly concerned with national defense of discoveries that have military value or significance, and the furnishing by such agencies, to the civilian agency established to direct and control nonmilitary aeronautical and space activities, of information as to discoveries which have value or significance to that agency;
7. Cooperation by the United States with other nations and groups of nations in work done pursuant to this Act and in the peaceful application of the results thereof;
8. The most effective utilization of the scientific and engineering resources of the United States, with close cooperation among all interested agencies of the United States, with close cooperation among all interested agencies of the united states in order to avoid unnecessary duplication of effort, facilities and equipment.

Example

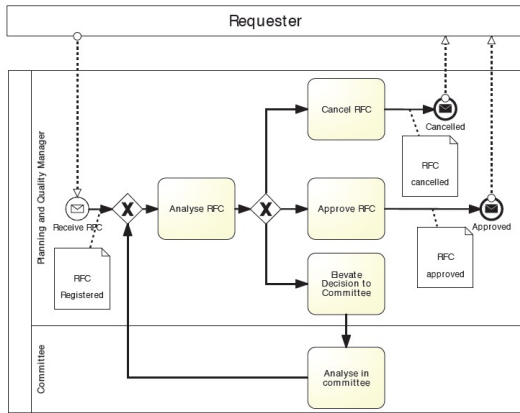

NASA'S GOALS AS OF 1961

“I believe that this nation should commit itself to achieving the goal, before this decade is out, of landing a man on the moon and returning him safely to the earth.” –John F. Kennedy

One more thing

The importance of automation

Common mechanisms to specify PPIs

Informal -
Natural language

	KPI	consultas	Indicador	Cálculo del indicador	Valor actual (SP)	Valor esperado	roles interesados	Observaciones
Calidad del lanzamiento	1	1.1	Frecuencia de PLs "reinstaladas"	% PLs "reinstaladas" en algún entorno, con o sin Marcha Atrás, sobre el total de PLs instaladas en el sistema.			GLANZ CTICO	Contamos Reinstalaciones sobre instalaciones en cualquier entorno, independientemente de que sean sobre la misma PL
	2	1.2	Media de Ejecuciones por PL	% ejecuciones sobre el total de PLs planificadas para ese periodo			GLANZ CTICO	por ejecución entendemos cualquier operación sobre una PL: instalación, reinstalación o desinstalación (que incluye la marcha atrás)

Low level-
implementation

Algoritmo 1 Contracción de caras libres maximales

Entrada: Complejo simplicial $K = \{\sigma_1, \dots, \sigma_n\}$ no vacío.

Salida: cierto si K es contractil y falso en caso contrario.

```

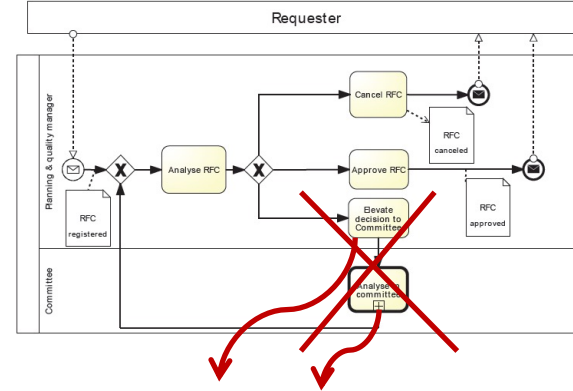

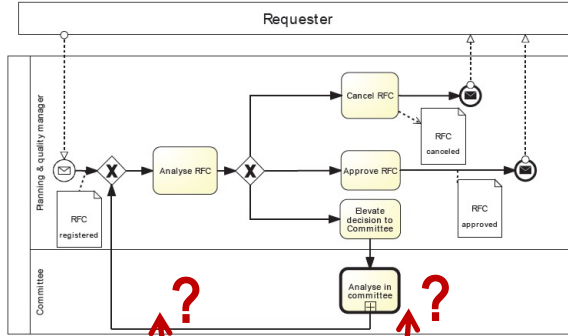

1 mientras  $K \neq \{\emptyset\}$  hacer
2   Elegir un simplejo  $\sigma_i$  de  $K$  que sea maximal y que contenga una cara libre  $\delta\sigma_i$ .
3   si no hay ningún simplejo de esas características entonces
4     devolver falso
5   si no
6      $K \leftarrow K \setminus \{\sigma_i, \delta\sigma_i\}$ 
7   fin si
8 fin mientras
9 devolver cierto
    
```

El algoritmo 1 es bastante raro, ¿qué diablos significa la línea 1.3?

```

SELECT
  Clientes.id_Cliente AS idCliente,
  Clientes.Razon_Soc AS Cliente
FROM
  Clientes
WHERE
  (Clientes.Eliminado <> 1)
AND (Clientes.Cta_Habilidad <> 0)
ORDER BY
  Clientes.id_Cliente,
  Clientes.Razon_Soc
    
```

Traceability

PROCESO	Información medida	KPI	Apartado para consultas	Indicador	Cálculo del indicador	Valor actual (SP)	Valor esperado	roles interesados	Observaciones
Calidad del lanzamiento		1	1.1	Frecuencia de PLs "reinstaladas"	% PLs "reinstaladas" en algún entorno, con o sin Marcha Atrás, sobre el total de PLs instaladas en el sistema			GLANZ CTICO	Contamos Reinstalaciones sobre instalaciones en cualquier entorno, independientemente de que sean sobre la misma PL
		2	1.2	Media de Ejecuciones por PL	% ejecuciones sobre el total de PLs planificadas para ese periodo			GLANZ CTICO	por ejecución entendemos cualquier operación sobre una PL: instalación, reinstalación o desinstalación (que incluye la marcha atrás)

We can find formal approaches

Formally conceptualizing the incorporation of measures and indicators into process modelling and design methods (Soffer & Wand, 2005)

Proposing an ontology to specify PPIs over semantic business processes (Wetzstein et al, 2008)

Using different variants of order-sorted predicate logic for their definition and relationship with goals (Popova & Sharpanskykh, 2010)

Presenting a metamodel for the definition of PPIs and its translation to DL for their subsequent analysis (Del-Río-Ortega, 2013)

Providing a semantic framework for representing PPIs by means of logical representation of formulas (Diamantini et al, 2016)

Proposing an ontology for PPI definition in the context of Knowledge Intensive Processes (Estrada-Torres et al., 2019)

Text-based

Templates (Castellanos et al, 2005, del-Río-Ortega 2016)

Spreadheets (Saldivar et al, 2016)

Automated transformation from natural language (Van der Aa et al, 2017)

Graphical notations

PPI template example

PPI-005	Average time of RFC analysis
Process	Request for change (RFC)
Goals	<ul style="list-style-type: none">• BG-002: Improve customer satisfaction• BG-014: Reduce RFC response time
MeasureDefinition	The PPI is defined as the average of the duration between the time instants when activity Analyse RFC becomes active and when activity Analyse RFC becomes completed
Target	The PPI value must be lower than or equal to 1 working day
Scope	The process instances considered for this PPI are those in Last 100 instances scope
Source	Event logs of BPMS
Responsible	Planning and quality manager
Informed	Chief Information Officer (CIO)
Comments	Most RFCs are created after 12:00
