Say “Hi” to Dave!

- This is **Dave**.
- **For the past 10 years**, Dave has successfully led his medium-sized company as CEO
- He’s **always relied on BPM** to leverage organizational performance
- Recently, however, **Dave’s company is increasingly losing market shares** to competitors – especially to highly digitalized start-ups

Say “Hi” to Dave!

- Dave’s **smart**, though
- Dave read about the ongoing **infusion of digital technology**, the **ongoing digital transformation** of businesses and highly **disruptive business model innovations**
- Ultimately, he read about the **Long Tail of Business Processes**

“Digitalization Is Eating Traditional BPM”

Top-down organized

Finance

HR

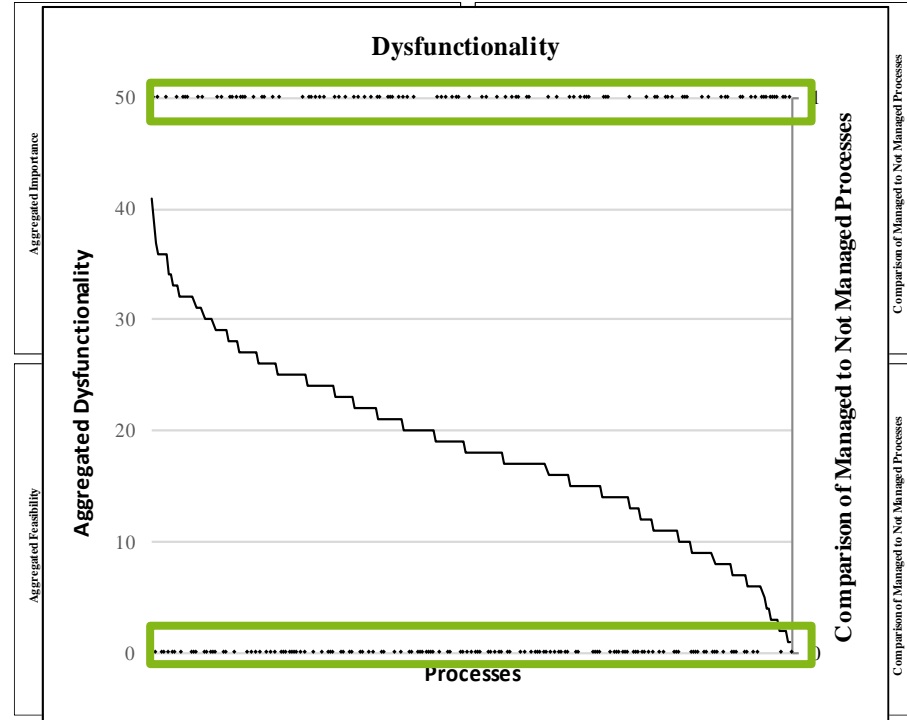

Bottom-up organized BPM

In practice, we observe two kinds of BPM

A Case with a Medium-sized Enterprise

- A medium-sized enterprise executes **235** processes important enough to have a process owner
 - Traditional BPM suggests to manage a **handful** of them at a time
 - That's less than **5%** !
-
- 95% do not receive adequate attention due to their cost-benefit ratio
 - Do these 5% really only account for 20% of the value?
 - Or is it more...?

Distribution of Managed Processes

Fischer et al. (2020)

Intermediate Findings

- Our findings indicate, that **neither central nor decentral BPM approaches** can fully realize the improvement potential in all processes of an organization

Robotic Process Automation

- Develop an automation (=robot) that is **functionally equivalent to a human** (acting in a specific business process)
- Characteristics of (ro)bots
 - RPA bots are **software** (robots)
 - RPA bots access only the **user interface**
 - RPA bots **execute activities** using **some rules**
 - RPA is **elastic** (one system, multiple bots)
- Result
 - **Scalable automation without change in legacy systems**

The screenshot shows the UiPath Studio interface for a project named "AmazonStockPriceRecorder". The main workspace displays a workflow diagram with a "Sequence" container, a "Web" container, and a "Do" container. The "Web" container includes an "Attach Browser 'Google Page'" activity, and the "Do" container includes a "Type into 'INPUT'" activity. The left sidebar shows the "Activities" pane with categories like Favorites, Recent, and Available. The top menu bar includes options like START, DESIGN, and EXECUTE.

The screenshot shows the Object Studio interface for a project named "Quanton Exception Helper". The main workspace displays a workflow diagram with a "Start" activity, a "Take screenshot code" activity, and an "End" activity. The "Take screenshot code" activity is highlighted, and its "Code Properties" dialog is open, showing the following code:

```

1 Output = "";
2 try
3 {
4 Rectangle bounds = Screen.GetBound
5 using (Bitmap bitmap = new Bitmap(
6 {
7 using (Graphics g = Graphics.F
8 {
9 g.CopyFromScreen(Point.Empty
10 }
11 bitmap.Save(FileLocation, Imag
12 Output = "Done";
13 }
14 }
15 ) catch (Exception ex)
16 {
17 Output = ex.Message;
18 }
19
  
```

The "Code Properties" dialog also shows the Name "Take screenshot code" and a Description field. The bottom status bar indicates the process is "Quanton Exception Helper" and the sub-sheet is "Take Screenshot".

Summary

- **“Digitalization is eating traditional BPM”**
 - Companies cannot lean back and manage only a handful of processes at a time
 - Companies have to deal with bottom-up initiatives
- **Bi-modal BPM can address both, the short head and long tail**
 - Guidance necessary for organizational, methodological & technological, as well as cultural implementation of Bi-modal BPM
- **RPA provides a technology to address the long tail**
 - Companies require guidance for intelligent process selection (and implementation)
 - Check Wanner et al. (2019) & Herm et al. (2020, 2021) but that’s another story...
- **Caveats!**
 - Bi-modal BPM principles only provide high level guidance
 - RPA long-term costs and benefits have not been sufficiently investigated
